ABSTRACT:

An object, such as a relational <u>database table</u>, <u>is partitioned</u> into a plurality of subsets. Selected subsets, e.g. <u>partitions</u>, of the object are exported into a <u>dump</u> file, identifying each exported subset of data by writing a marker in the <u>dump</u> file. Selected subsets are imported from the <u>dump</u> file, by determining whether the marker in the <u>dump</u> file corresponds to the selected subsets, then conditionally importing the data associated with the marker. Objects are repartitioned by exporting the some of the subsets, reconfiguring the object, and importing the exported subsets back into the object.
